

# CS551: Introduction to Deep Learning

## Mid Semester, Spring 2018

### IIT Patna

**Attempt all questions. Do not write anything on the question paper.**

Time: 2 Hrs

Full marks: 30

1. Prove or disprove:  $tr(AB) = tr(A) \times tr(B)$  where  $A$  and  $B$  are  $n \times n$  matrices and  $tr$  denotes the trace. (3)
  
2. A diagnostic test has a probability 0.95 of giving a positive result when applied to a person suffering from a certain disease, and a probability 0.10 of giving a (false) positive when applied to a non-sufferer. It is estimated that 0.5% of the population are sufferers. Suppose that the test is now administered to a person about whom we have no relevant information relating to the disease (apart from the fact that he/she comes from this population). Calculate the following probabilities: (a) that the test result will be positive; (b) that, given a positive result, the person is a sufferer; (c) that, given a negative result, the person is a non-sufferer; (d) that the person will be misclassified. (1+1+2+2)
  
3. Consider a neural network where the last output layer uses softmax as activation function for some classification problem. Following is an observation on three training examples where  $o_i$  denotes the probability of each class from softmax and  $t_i$  denotes the labeled target for the examples. Find out mean cross entropy error for these three examples. (5)

$o_1$	$o_2$	$o_3$	$t_1$	$t_2$	$t_3$
0.1	0.3	0.6	0	0	1
0.2	0.6	0.2	0	1	0
0.3	0.4	0.3	1	0	0

4. Consider maximal margin classifier for the following toy data set which has two features  $X_1$  and  $X_2$ .  $Y$  is the target label. (a) Sketch the optimal separating hyperplane, and provide the equation for this hyperplane. [Equation for hyperplane may be derived logically or mathematically.] (b) On your sketch, indicate the margin for the maximal margin hyperplane. (c) Indicate the support vectors for the maximal margin classifier. (3+2+1)

Sl. No.	1	2	3	4	5	6	7
$X_1$	3	2	4	1	2	4	4
$X_2$	4	2	4	4	1	3	1
$Y$	R	R	R	R	B	B	B

5. Given a set of  $m$  points  $\{\mathbf{x}^{(1)}, \mathbf{x}^{(2)}, \dots, \mathbf{x}^{(m)}\}$  in  $\mathbb{R}^n$  and we want represent these points in  $k$  dimension where  $k < n$ . Propose a suitable methodology for it. (10)
